PLAYWRIGHT TYPESCRIPT IMPACT ANALYSIS

```
"types": ["@playwright/test"],
"noEmit": true
},
"include": ["tests", "frontend/tests", "playwright.config.ts"]
}
```

Suggested package.json additions (merge into existing)

- Add devDependency: @playwright/test
- Add scripts:

```
{
  "scripts": {
    "test:e2e": "playwright test",
    "test:e2e:headed": "playwright test --headed",
    "test:e2e:debug": "playwright test --debug"
  }
}
```

Commands to run locally

```
# from repo root
cd frontend
npm install -D @playwright/test
npx playwright install
# run tests (will start vite via webServer)
npx playwright test
```

+ .env

npx playwright install
# run tests (will start vite via webServer)
npx playwright test
```

Notes & optional improvements

- If your frontend dev script is named differently than dev, change webServer.command to npm --prefix frontend run <your-script>.
- For full-stack E2E, add a backend webServer in playwright.config.ts or start the backend in a separate step (ensure backend listens on PORT from .env).
- Add stable test selectors (data-testid or data-e2e attributes) in frontend components for reliable targeting.
- If you prefer tests scoped to the frontend folder, move playwright.config.ts there and change webServer.command to npm run dev.

Would you like me to generate these files content into the repo (scaffold) and update package.json suggestions for you?

Story Title *

As a registered user, I want to reset my forgotten password via email, so that I can regain access to my account without contacting support.

Description

Currently, users who forget their password have no self-service way to regain access to their account. They must contact customer support, which creates unnecessary workload for the support team and a poor experience for users. This story implements a "Forgot Password" flow where a user can request a password reset link via their registered email address, click the link, and set a new password securely.

Acceptance Criteria *

Given a user is on the login page, when they click "Forgot Password," then they are taken to a page where they can enter their registered email address.

Given a user enters a valid, registered email address, when they submit the form, then a password reset link is sent to that email and a confirmation message ("If an account exists, a reset link has been sent") is displayed.

Given a user enters an email that is not registered, when they submit the form, then the same generic confirmation message is shown (no indication of whether the email exists, for security reasons).

Given a user receives the reset email, when they click the reset link within 30 minutes, then they are taken to a "Set New Password" page.

Given the reset link is older than 30 minutes or has already been used, when the user clicks it, then they see an error message stating the link has expired, with an option to request a new one.

Given a user is on the "Set New Password" page, when they enter a new password that doesn't meet complexity requirements (min 8 characters, 1 number, 1 special character), then an inline validation error is shown and the form is not submitted.

Given a user successfully sets a new password, when the submission completes, then they are redirected to the login page with a success message and can log in with the new password.

Given a password is successfully reset, when the process completes, then all existing active sessions for that user are invalidated.

Additional Info

Story Points: 5

Dependencies: Email service integration (SMTP/SendGrid) must be available

Non-functional requirements: Reset link must be a single-use, cryptographically secure token; email delivery should occur within 60 seconds

Out of scope: Password reset via SMS (to be covered in a separate story)

Design reference: Link to Figma mockup (placeholder)

QA notes: Test across Chrome, Firefox, Safari; verify token expiry edge cases
